

Preparing for Milestone D1

Product backlog document

In your product backlog, detail the Functional Requirements (FRs) and related Non-Functional Requirements (NFRs) for each service; include **all** relevant FRs and NFRs. (Use the [template](#) given on Canvas for the product backlog.)

Note: We don't require a submission until September 17th, but you must keep this document ready during the presentation to answer questions/clarify concerns, if any.

Presentation

Duration: 20 mins for the presentation + 10 mins for Q&A.

Prepare a simple slide deck following the items below. You are required to submit the slide deck on Canvas after your presentation.

Note: Beautification of slides carries no marks! So, don't spend time on it. Avoid reading a script while presenting your work.

In your presentation, focus on the following few critical requirements and their refinements from the product backlog.

Note: This does not mean you prepare only 1 FR and NFR for each service. You should have the backlog ready.

1. **Must-Have Requirements:** Choose the key FRs and NFRs that are essential for the system to work. Match each one with a specific microservice.
 - User Service: 1 FR and 1 NFR. These should be relevant to user roles and/or role-based access control.
 - Supplier Service: 1 FR and 1 NFR. These should be specific to storing supplier information.
 - Order Service: 1 FR and 1 NFR. These should be specific to handling the errand states in the requests.
 - Credit Service: 1 FR and 1 NFR. These should be specific to handling wallet updates upon transaction completion.
 - UI: Include the mock-up you have created to showcase the product.
2. **Edge Cases:** At least four edge cases you will be handling relevant to the FR/NFR above.
 - Alternative workflows are not considered edge cases. For example, a user choosing to cancel a request creation is not an edge case.
 - An edge case could be *"What should happen when a user is disconnected while creating a request?"*
3. **Nice-to-Haves:** Choose two of the nice-to-haves you are considering and tell us what has been discussed about them by your team so far. Refer to [Milestone D1 Tasks](#) for the expectations.
4. **Role/task Allocation:** What is the tentative role/task allocation in your project (i.e., who is implementing what part of the project)?

Presentation slots

Refer to this [spreadsheet](#) for your selected presentation slot.

Additional notes/resource

- Refer to [the slides](#) Dr. Akshay used in the lecture to review some fictitious backlog entries, and recollect the discussions/review the lecture video when preparing the product backlog.
-
- When you develop your backlog entries, think about how a designer or a developer will use each of them to design/implement the feature(s).
 - Ask yourself: Is the entry unambiguous, testable/verifiable, complete, and consistent with other entries?
 - For the presentation, ask yourself: Which backlog entry gives the most information about the feature you are presenting? E.g., “Supplier service should allow updating the supplier information V.S., Supplier service should allow storing <various fields> pertaining to each supplier,” and their refinements.
